

# Importance of Early Childhood Intervention for Children with Autism

## Reason 1

An Early diagnosis can mean a child gains access to important therapies and resources when they can be most effective.

## Reason 2

ABA Therapy is shown to be most effective on toddlers and young children because their brains are not completely developed and have increased potential for developing new learning pathways!

## Reason 3

Children who receive Early Intervention has improved outcomes and increased success and independence later in life.

## Statistics!

Important skills like walking, talking and social interaction are all learned from birth to 3 years old.

All treatment plans are individualized to the child and needs of the families.

89.9% of Early Childhood Intervention such as ABA Therapy, said they saw an improvement in their child's communication skills.

According to the CDC study from 2016, even though ASD can be diagnosed as early as the age of 2, most children are not diagnosed with ASD until age 4.
